

INDEX TO VOLUME 23 (1979)

The following listing of the content of *Canadian Electronics Engineering* magazine for 1979 is arranged by general topic headings. Because the Index is not large, no attempt at cross-indexing has been made. Where an article could reasonably fall under several headings, it has been listed only under the most appropriate. About 190 news items were published during the year and these have not been listed separately. Entries are by month and the beginning page number.

ASSOCIATIONS

Association leaders look into the Eighties Jan 23
EEMAC group ponders future Aug 38

AVIONICS

Aircraft flat panel displays relieve cockpit real estate Mar 18
Canadian company world leader in aircraft temperature control Mar 29

The Design Engineer's Guide to Fasteners

PEM® Miniature, Self-Locking, Self-Clinching Fasteners are designed to fit into minimum space, yet provide strong threads on thin panels. They do not require special installation tools and will match all standard drill or punch size tolerances.

Types FE, FEO and UL feature self-locking as well as thread-locking abilities. The thread barrel is elliptically formed to provide self-locking thread pressure. At the same time the 303 grade Stainless Steel remains ductile so that excess thread pressure and galling is avoided.

PEM® Self-Clinching Standoffs. The PEM design, proved over many years, makes these self-clinching standoffs both easier and less expensive for electronic manufacturers to assemble enclosures, circuit boards and components that must be stacked or spaced. This self-clinching design, with its flush mounted head, imbeds the hexagonal head into the ductile metal panels to create high torque resistance while locking the standoff securely into the panel.

Printed Circuit Board Fasteners. When your design calls for printed circuits, or other thin panels made from relatively hard and brittle materials such as glass laminates or epoxy, PEM Broaching-Type Fasteners produce superior results. They permanently lock in the material as the knurled shank of the fastener is pressed into a pre-drilled hole.

All PEM Fasteners visually indicate when they have been inserted to the proper depth under pressure. Correct installation requires only the required hole size and pressure applied between the parallel surfaces.
